

1. Use Splinter and/or Beautiful Soup to scrape [mercadolibre.com.mx](https://www.mercadolibre.com.mx) or soundcloud.com or tripadvisor.com. You must programmatically click a link from the front page to go to another page of interest to you and then select at least 5 items from that page. The 5 items must be stored in a data structure that makes sense (dictionary, list, etc).
2. Share with your group how web scraping worked on the website and link you chose. Compare it with others. List the site you chose and two observations about parsing the website. Indicate if this was the same or different for the sites chosen by others.
